

From ancient sugar factories to modern bio-refineries

BIO-ETHANOL

SUGAR

BIO-ENERGY

BIO-FERTILIZER

BIO-BYPRODUTOS

Internal Driving-forces:

Pró-álcool (1975);

•Flex fuel vehicles.

External driving-forces:

•Global warming;

•Ethanol demand in 20 years estimated in 200 billion liters year.

Biofuel

The energy from sugar cane

Consumption of process steam depends on proportion of sugar and ethanol produced:

- Ethanol plant →260-270 kg/TC
- Sugar (50%) + ethanol (50%) →300 - 340 kg/TC
- 1 TC = 240 kg de bagasse (50% humidity) = 528 kg of steam + 240 kg of leaves.

Cane processing units have surplus of energy:

2.000MW (2007) with estimated potential of 20.000MW, equivalent to two ITAIPUS.

Composição média da cana-de-açúcar

Composition	(%) m/m.
Water	65-75
Sugars	11-18
Fiber	8-14
Solubles	12-23

Environmental impact (Macedo, 2002)

$$\frac{\text{renewableEnergy}_{output}}{\text{fossilEnergy}_{input}} = 8.3$$

Technology of bioethanol production in Brazil - overview

Technology of bioethanol production in Brazil - overview

Main process characteristics:

- Lack of sanitary criteria in the design;
- Mash w/ low ethanol titre (8.5% v/v, avg);
- Presence of contaminants & insolubles;
- High volume of vinasse produced (10-15 l/l);
- Energy consumption in distillation.
- Intensive use of sulfuric acid and human antibiotics or chemically related to (260 t in 2008 crop season).

Technology of bioethanol production in Brazil - overview

Biostil/Biostil 2000 fermentation process (CHEMATUR)

- Vinasse recycle to fermentation;
- Fermentation under high osmotic pressure by salts (non sugars);
- 3 l/l;
- Low yield;
- Discontinued in Brazil.

Technology of bioethanol production in Brazil - overview

- 1990's: Focus on biocatalysts/fermentation modelling (Andrietta *et. al.*, 1994, 1995,1999)
 - Studies on populational dynamics in fermentation carried out by CTCopersucar spread the use of selected and more adapted yeast strains.
 - Methodology to asses fermentative capability of yeasts based on kinetics, productivity and yield parameters (Andrietta *et. al.*1999).
- 2000's: Focus on contamination (Nolasco Junior, 2005,2009)
- Studies comprising technologies to manage contamination preventively:
 - Design and validation of an optimal thermal process to must based on thermal degradation kinetics of sugars and heat resistance of spores of *B. stearothermophilus*.
 - Contamination modelling in fermentation through operational parameters.
 - Design of must treatment process to ethanol production (computational fluid dynamics)
 - Design of fermentation process based on sanitary criteria (bioprocess)

Optimized thermal process for must

$$B_v = f(R_c, \mu_{maxB}, B_m)$$

Technology of bioethanol production in Brazil - overview

- Antibiotic therapy

- Identical microbial ecology can be found in Brazilian sugar cane, US corn ethanol, beet and lignocellulosic compounds, the so called 2nd generation biofuel: gram positive bacteria from genera *Bacillus* e *Lactobacillus* (Klaushofer *et al.* 1998; Gallo e Canhos 1991; Skinner e Leathers, 2004; Klaushofer *et. al.*, 1998; Schell *et. al.*, 2007).
- Resistance associated to continuous use of antimicrobials or Antibiotic Pressue.
- US: 25000t/a, being 50% to human and 50% in non human use (agriculture, veterinary, acquaculture, animal feed).
- Biofuel worldwide increasing list of non-human use of antibiotics.
- Antibiotics are the scope of a current and future war: that of antibiotics resistance that will be lost if there is not a global awareness about the problem adopting strategies to defeat it (Wannmacher 2004).

Company Overview

Amyris corporate office in Emeryville, CA

Amyris Crystalsev Biocombustíveis in Campinas, Brazil

- **Amyris is the leader in the race to produce and market advanced renewable fuels and chemicals**
 - **Proprietary technology that creates best-in-class fuels and chemicals (“programmed yeast”)**
 - **Using industrial platform at sugar mills to ferment higher value added products**
 - **Comprehensive business model (i.e. GreenLane™) that enables us to take fuel from the plant to the market**

Amyris today

Chicago, Illinois

- Amyris Fuels LLC
- Renewable fuels marketing and distribution

Europe

- Anti-malarial partnership with sanofi-aventis

Alabama

- sugar cane nursery project

Emeryville, California

- ABI headquarters
- labs, pilot plant

Campinas, Brazil

- Amyris Brasil
- labs, pilot plant & demo facility
- production in 2011

... combining great science and innovative business to create a more sustainable world
